

YaySchedule - Professional & Business Profile

Created by Mahesh Arora • Value Proposition & Professional Highlights

1. Professional Summary

YaySchedule is a local-first, mobile-responsive Progressive Web Application (PWA) engineered to act as a centralized dashboard for events, reminders, and knowledge management. By leveraging local databases and cloud replication layers, it provides zero-latency interactions and reliable offline operation.

2. Key Innovations & Business Value

- Local-First Storage Architecture: Uses Dexie.js (IndexedDB wrapper) for sub-millisecond local reads/writes, ensuring the app remains usable even under zero-connectivity scenarios.
- Real-time Cloud Replication: Connects to a secure Supabase sync layer to unify data state across client devices without risking data-loss on new device initialization.
- Hybrid NLP Interface: Incorporates an offline-friendly natural language parser (Chrono-node + Compromise) alongside Gemini/OpenRouter AI providers to parse tasks seamlessly.

3. Resume / Profile Description Template

Mahesh Arora | Lead Software Engineer

- Architected and deployed YaySchedule, a cross-device synced PWA scheduler & organizer supporting offline-first transactions.
- Integrated natural language processing libraries (Chrono-node, Compromise) and Gemini/OpenRouter LLMs to enable grammar-corrected, conversational scheduling tools.
- Implemented a robust data sync protocol with Supabase PostgreSQL to prevent empty client overrides during connection restoration.
