

YaySchedule - Mahesh Arora's Guide

Personal Developer Manual, Maintenance Cheat-Sheet & Commands

1. Core Philosophy

YaySchedule is your custom-built personal cockpit. It was created to combine high-end aesthetics, premium typography, absolute privacy, and offline capabilities. You own the code, you own the domain, and you control where your sync data goes.

2. Maintenance & Commands

- Local Run: Run 'npm run dev' to start local development server at `http://localhost:3000`.
- Production Build: Run 'npm run build' to confirm typescript compilation and generate static routes.
- Deploy: Run 'npx vercel --prod --yes' to immediately update the live website.

3. Slash Commands Quick Reference

- '/reminder Buy groceries tomorrow at 5 PM' -> Adds reminder, parsed with correct grammar.
- '/event Product Launch meeting next Monday 10:00' -> Creates a calendar event.
- '/note Design Ideas' -> Opens/creates a note with the specified title.

4. Backup Strategy

Always go to Settings -> click 'Export Backup' to save a JSON copy of your local data. Keep your Supabase credentials secure. Since the repository is pushed to GitHub, you will never lose your project files as long as you maintain your account credentials.
